CONVERSION FACTORS AND VERTICAL DATUM

Multiply	By	To obtain
acre-foot	1,233	cubic meter
cubic foot per second (ft ³ /s)	0.02832	cubic meter per second
foot (ft)	0.3048	meter
inch (in.)	2.54	centimeter
mile (mi)	1.609	kilometer

For temperature, degrees Celsius ($^{\circ}\text{C}$) may be converted to degrees Fahrenheit ($^{\circ}\text{F}$) by using the formula $^{\circ}\text{F} = [1.8(^{\circ}\text{C})] + 32$.

SEA LEVEL

In this report, "sea level" refers to the National Geodetic Vertical Datum of 1929 (NGVD of 1929, formerly called "Sea-Level Datum of 1929"), which is derived from a general adjustment of the first-order leveling networks of both the United States and Canada.

Physical, Chemical, and Biological Data for Detailed Study of Irrigation Drainage in and near Stillwater, Fernley, and Humboldt Wildlife Management Areas and Carson Lake, West-Central Nevada, 1987-89

By

Timothy G. Rowe¹, Michael S. Lico¹, Robert J. Hallock²,
Ann S. Maest¹, and Ray J. Hoffman¹

ABSTRACT

Physical, chemical, and biological data associated with irrigation drainage were collected between September 1987 and December 1989 at several sites in and near Stillwater, Fernley, and Humboldt Wildlife Management Areas, and Carson Lake, Nevada. The data were collected in support of the U.S. Department of the Interior program of detailed studies of irrigation-drainage projects in the western United States.

This report contains data on trace-element concentrations in samples of surface water, ground water, drift and detritus, bottom sediment, pore water, and biota (plants, invertebrates, fish, and waterfowl). Other data presented in the report include surface-water discharge; ground-water levels; lithology of wells; mineralogy of cores and bottom sediment; concentrations of major dissolved constituents, nitrogen, phosphorus, organic carbon, and radiochemical constituents in water; and particle-size determinations and concentrations of organochlorine pesticides and organic carbon in bottom sediment.

INTRODUCTION

Background

A reconnaissance investigation by the U.S. Department of the Interior (DOI) in 1986-87 (Hoffman and others, 1990) indicated that potentially toxic contaminants in irrigation drain water could pose a threat to human health, fish, and wildlife in and near Stillwater Wildlife Management Area (WMA), Nevada. The study results indicated that samples of water, bottom sediment, and biota in areas affected by irrigation drainage contained concentrations of arsenic, boron, mercury, and selenium that exceeded either background levels or Federal and State criteria for the protection of human health, fish, and wildlife. Furthermore, the authors indicated (p. 75) that other contaminants in the study area were of environmental concern--namely, chromium, copper, zinc, un-ionized ammonia, sodium, and salinity.

¹ U.S. Geological Survey.

² U.S. Fish and Wildlife Service.

Because the 1986-87 reconnaissance investigation was not designed to determine cause-and-effect relations, and because of continued concern expressed by DOI regarding the possible adverse effects of irrigation drainage on wildlife resources, a more detailed study of the source, transport, and fate of potentially toxic contaminants in and near Stillwater WMA commenced in 1988. The working objective for this detailed study was to determine the extent, magnitude, and effects of contaminants associated with agricultural drainage and, where effects are documented, the sources and exposure pathways that cause contamination.

The genesis of the Stillwater WMA investigation, one of several reconnaissance-level studies initiated by DOI in 1986, is described in detail by Deason (1986). For additional background information on the potential adverse effect of poor-quality agricultural drainage on fish and wildlife, and its relation to the DOI irrigation drainage program, the reader is encouraged to consult articles by Presser and Ohlendorf (1987), Deason (1987), and Sylvester and others (1988).

Purpose and Scope of This Report

The purpose of this report is to present, in tabular and graphical form, much of the physical, chemical, and biological data collected as part of the detailed study of irrigation drainage in Stillwater, Fernley, and Humboldt WMA's and in Carson Lake. Some of the project data are published elsewhere (see section on "Sources of study-funded data not tabulated herein" in this report). In scope, this report includes hydrological and geochemical data from 84 sampling sites (surface water plus ground water) and biological data from 100 sampling sites. Data were collected in 1987-89, either discretely or continuously, on the basis of seasonal irrigation practices and (or) biological productivity and life-cycle patterns of resident and migratory waterfowl in the study area. These data represent a collective effort by scientists of the U.S. Fish and Wildlife Service (USFWS) and the U.S. Geological Survey (USGS).

Acknowledgments

The authors gratefully acknowledge the assistance of the following individuals in the design of the data-collection program and the collection of data in the three WMA's and Carson Lake: Norman A. Saake of the Nevada Department of Wildlife; Ronald M. Anglin, Timothy D. Bowman, Howard L. Burge, Gerald L. Deutscher, Leslie J. Dubuc, William G. Henry, C. Anne Janik, Linda L. Kerley, and Steven P. Thompson of the U.S. Fish and Wildlife Service; Theodore G. Roefs of the U.S. Bureau of Reclamation; and Robert E. Bostic, Jennifer L. Hughes, and Laurence G. Miller of the U.S. Geological Survey.

STUDY AREAS

The study areas (fig. 1) are part of the Basin and Range physiographic province in west-central Nevada. Stillwater WMA and Carson Lake are terminal-sink areas in the lower Carson River drainage system; Fernley WMA is adjacent to the Fernley Sink, about 20 mi southeast of Pyramid Lake and 30 mi west of the Stillwater WMA. Humboldt WMA is part of the Humboldt Sink, which, except during unusually high runoff, is the terminus of the Humboldt River drainage system. Humboldt WMA is about 40 mi east of Pyramid Lake and 20 mi north of Stillwater Wildlife Management Area. Relevant sources of technical information about the study areas include Eakin and Lamke (1966), Glancy and Katzer (1976), Hallock and others (1981), Van Denburgh and Arteaga (1985), Brown and others (1986), and Hoffman and others (1990).

DATA-COLLECTION SITES

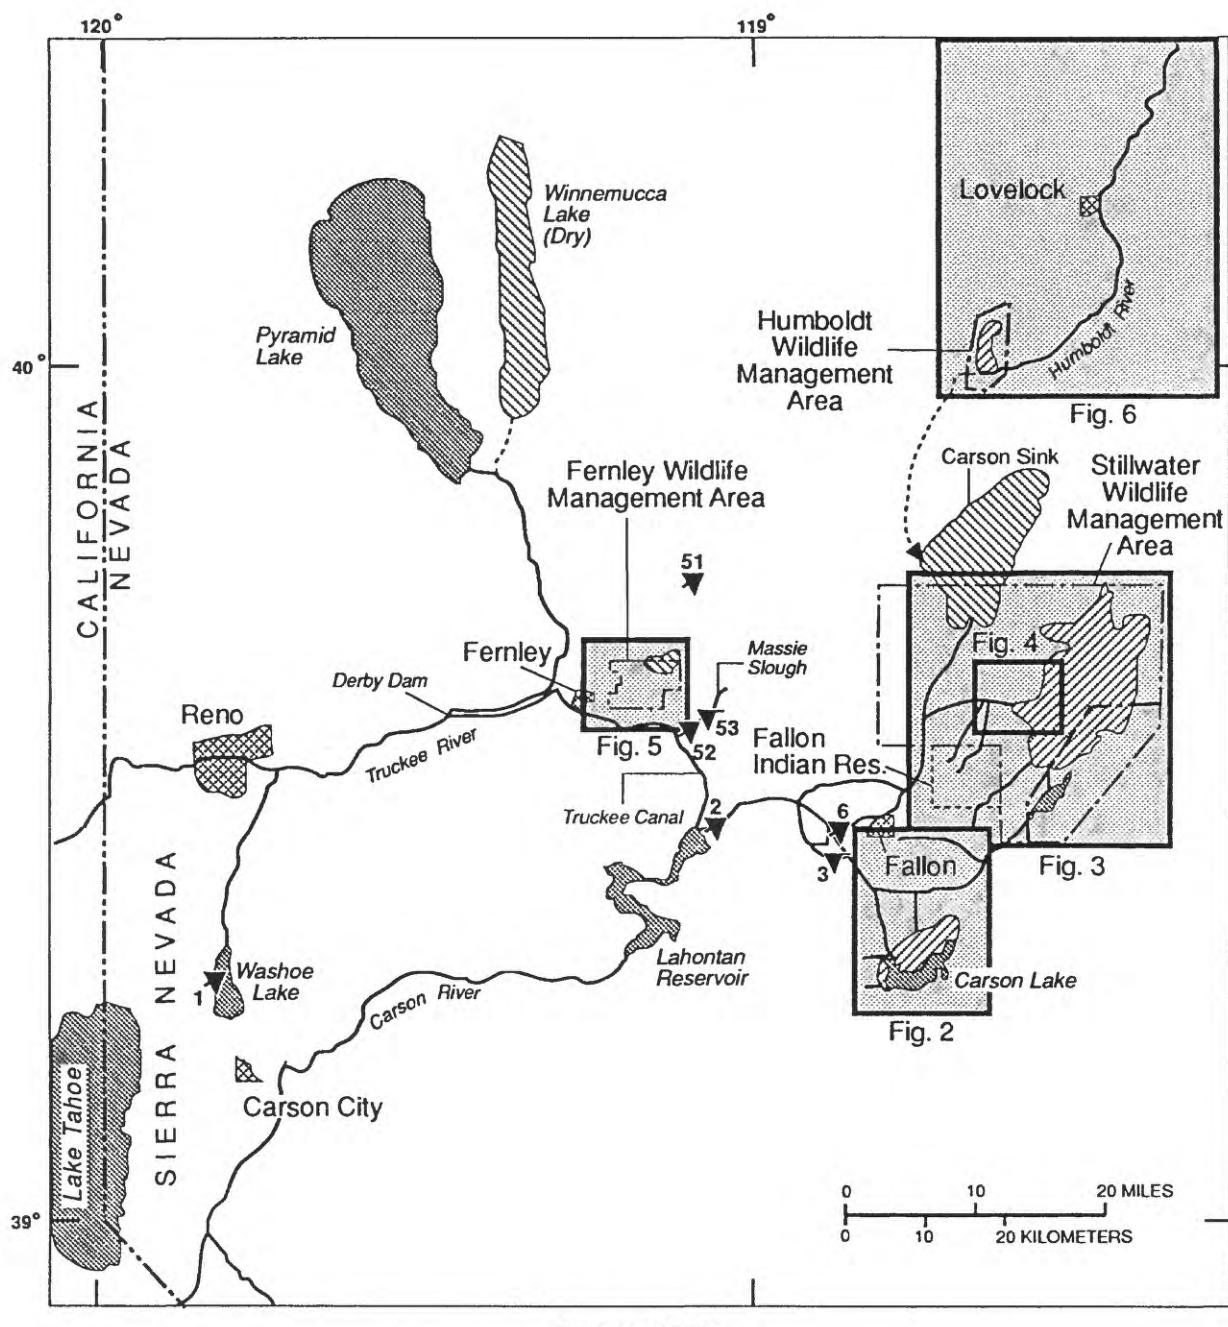

The principal data-collection sites for the detailed study are listed in tables 1 and 22, in downstream/downgradient order, for the most part. Site locations are shown in figures 1-7. Of the principal sampling sites, 37 were in Stillwater WMA, 22 in Fernley WMA, 5 in Humboldt WMA, 13 in the Carson Lake area, and 5 were background sites (reference sites unaffected by irrigation drainage). Additional sites were sampled by USFWS on a "one-time" basis for drift, detritus, and, if present, attached algae in agricultural drains throughout the Fallon agricultural area. Data for these additional sites are listed in tables 20 and 21 and site locations are shown in figures 5 through 7.

SAMPLE COLLECTION, PRESERVATION, AND ANALYSIS

Instantaneous onsite measurements of surface-water discharge and quality, and collection of water samples for laboratory analysis, began in September 1987 and ended in December 1989. Measurements of water temperature, specific conductance, pH, and dissolved oxygen were recorded at six sites during the period from July 1988 to December 1989; surface-water discharge was recorded at four of the six sites. Samples of intra-sediment pore water were collected in August 1989 as part of an investigation to quantify arsenic and selenium speciation in selected aquatic environments. Core materials were collected from November 1987 to January 1989, and biological samples for trace-element analysis were collected from October 1987 to November 1989.

The field and laboratory procedures used for onsite measurements of ambient flow and water quality (water temperature, specific conductance, dissolved oxygen, Eh, pH, and alkalinity) and collection, preservation, and analysis of samples of surface water, ground water, bottom sediment, and biota mostly were the same as those used during the 1986-87 reconnaissance investigation (Hoffman and others, 1990, p. 19-24). Exceptions or additions to those procedures are elaborated below.

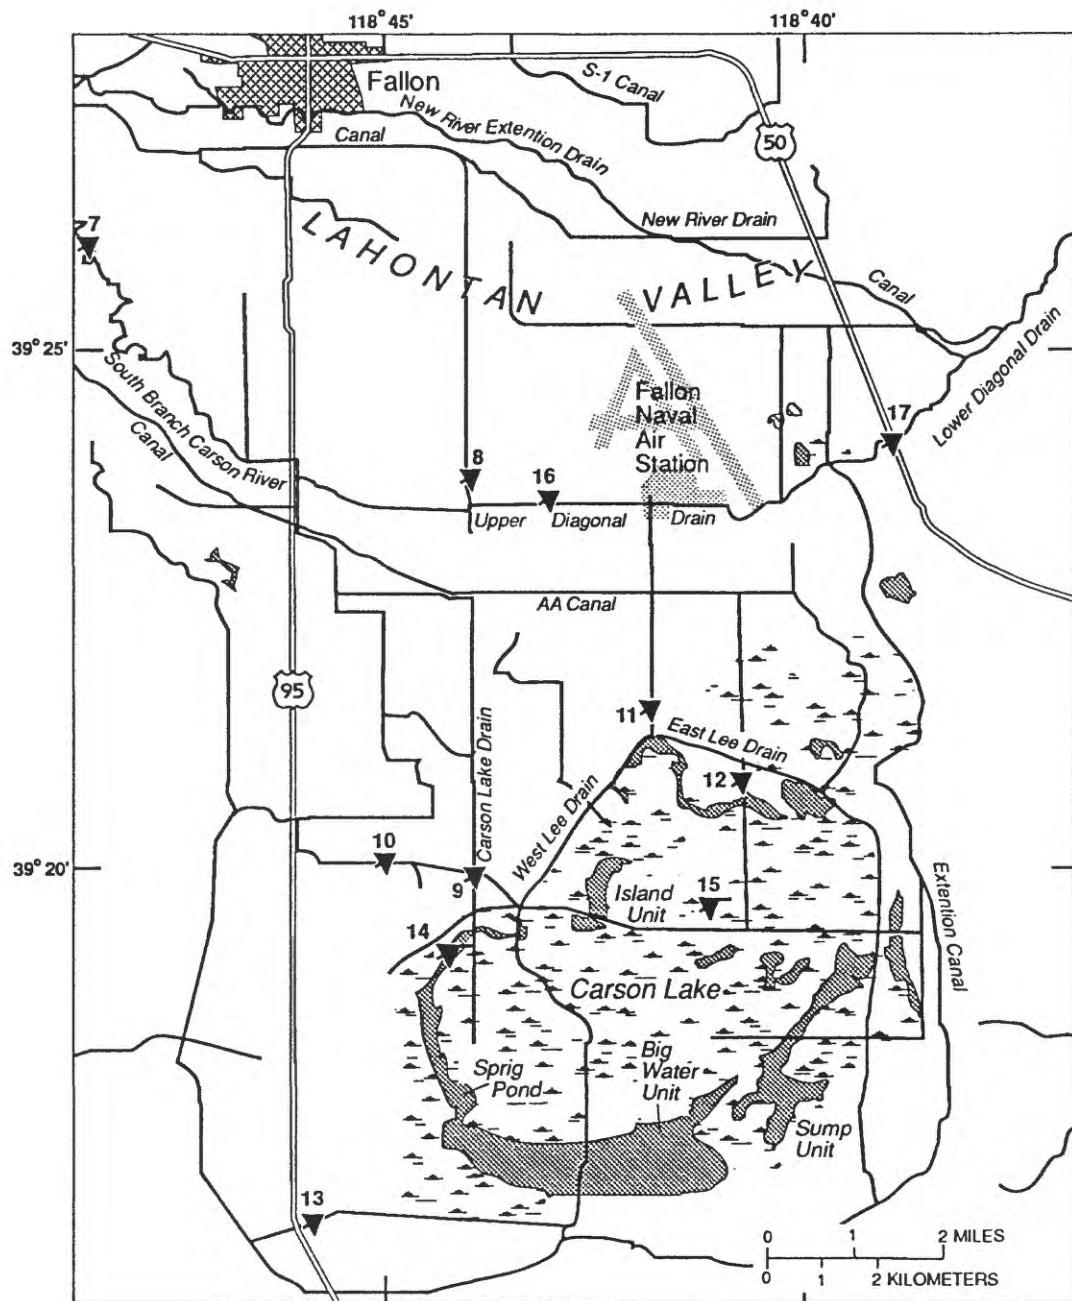

Measurements of flow were made by using a float-type gage with digital recorder (Rantz and others, 1982, p. 26 and 36). Measurements of water temperature, specific conductance, pH, and dissolved oxygen were made by using a USGS minimonitor (Gordon and Katzenbach, 1983) and a digital recorder.

Samples for determination of stable-isotope ratios (oxygen-18/16, hydrogen-2/1, carbon-13/12, and sulfur-34/32) in ground water were obtained according to the procedures described by Wood (1976, p. 2-8), and were analyzed using the procedures of the U.S. Geological Survey (Pritt and Jones, 1990, table 5.2). Iron species were determined colorimetrically using a modified version of the ferrozine method described by Stookey (1970). Arsenic species were determined by hydride-generation atomic-absorption spectrometry. Mineral analysis of sediment cores was done using X-ray diffraction techniques (Carroll, 1970, p. 51-61; Nuffield, 1966, p. 130-137) and an optical petrographic microscope for the examination of thin sections.

Total analyses of bottom sediment and core material were made as described by Hoffman and others (1990). Total-recoverable analysis of bottom sediment and core material represents a partial dissolution of sediment using methods described by Fishman and Friedman (1985) in which organic matter in the sediment was destroyed with hydrogen peroxide, then the sediment was extracted with a hot hydrochloric-acid solution. The resulting solution was analyzed for specified trace elements by atomic-absorption spectrometry or, in the case of boron, a colorimetric procedure.

Cores were collected from Hunter Drain (two sites), Massie Slough, and Lead Lake at South Lead Lake landing (one site each) in polyvinyl-chloride tubes by physically pushing the tube into the sediment. The cores were vertically extruded in 0.8-in. segments and placed in a nitrogen-pressurized squeezer which expressed the pore waters through a 0.45- μm sterile filter directly into collection syringes. Temperature, pH, and Eh were measured on pore-fluid extracts. Pore waters were analyzed for chloride and sulfate with a Waters liquid chromatograph equipped with an IC-PAC A 10 polymethacrylate column (Oremland and others, 1990). Sulfide was determined colorimetrically after fixing with zinc acetate (Cline, 1969). Nitrate was determined by autoanalyzer (Oremland and others, 1990), iron and arsenic by graphite-furnace atomic absorption spectrometry (Slavin and others, 1983; Schlemmer and Welz, 1986), and selenite by flow-through hydride-generation, atomic absorption spectrometry (Oremland and others, 1990).

Samples of plant and animal drift (suspended material in water) were collected in drains₂ using stationary nylon nets with frame openings of about 212 in. and netting with a 0.02-in. mesh size. The nets were placed in flowing water for about 24 hours to retain both living and dead plant and animal material in transit. The drift samples were classified as plant or animal depending on the dominant biota captured.

Samples of detritus for trace-element analysis were collected using a "slurp-tube" suction device (fig. 8) in shallow water (depths less than 6 in.). Detritus, which is defined as the upper 0.8 in. of oxic bottom sediment, consists of fine particulate debris, mostly organic. The sampling apparatus was constructed of two interlocking polyethylene funnels and an 18-in.-long polyethylene tube. Prior to submergence in water, the "funnel" was inverted with thumb held firmly over the tube opening. After gently contacting the sediment surface, thumb pressure was released. This action caused entrained air to rush out the tube and water and detritus to rush in to fill the vacuum created. About 20 detrital samples were collected at each site and

subsequently composited in a polyethylene bottle. After the sample was allowed to settle, excess water was decanted. The samples were then frozen in 1.5-in.-diameter plastic tubes, whereafter the frozen sample was extruded from the tube and sliced to separate the uppermost (lightest weight) fraction from the bottom (heaviest weight) fraction. The lighter weight component was refrozen in acid-rinsed bottles and shipped to the U.S. Fish and Wildlife Service Laboratory in Laurel, Md., for chemical analysis.

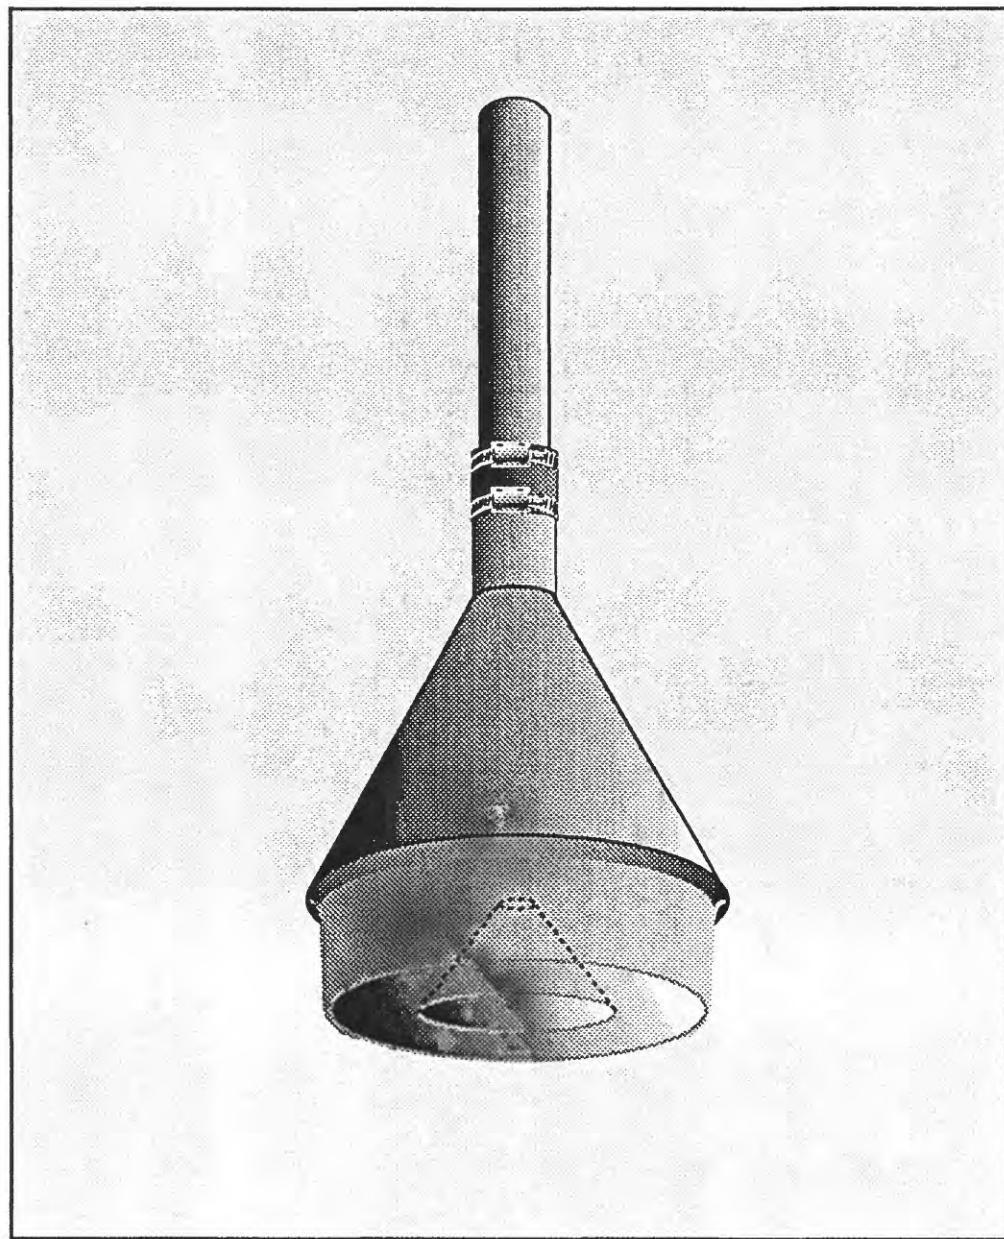

Figure 8. --Detritus sampling device, or "slurp tube" (shown about one-sixth actual size).

Adult brine-fly larvae, *Ephydria* species, were collected by using a commercially supplied vacuum-generation apparatus. The opening of an attached vacuum hose (suction tube) was covered with a piece of nylon window screen. Under vacuum, the suction tube was passed rapidly above both resting and near-surface airborne flies. Captured flies were held fast against the screen by the vacuum suction until the vacuum was terminated, after which large clusters of stunned flies were released into 1-gallon, wide-mouth polyethylene jars and immediately frozen. About a day later, the samples were picked free of litter, weighed, and placed in 2-ounce jars for subsequent shipment and chemical analysis.

The same stringent quality-assurance practices that were used in the 1986-87 reconnaissance investigation (Hoffman and others, 1990, p. 21-24) were continued in the 1987-89 detailed study. Quality-control data for trace-element analyses were obtained using field blanks. A field blank is a volume of deionized water that is treated as a water sample in all aspects, including exposure to water-sample containers (collecting bottle and churn splitter), filtration apparatus, chemical preservatives, holding times, and laboratory processing.

COMPILATIONS OF PHYSICAL, CHEMICAL, AND BIOLOGICAL DATA

Data listed herein are for the following: Surface-water and bottom-sediment--tables 1-19; biological, drift, and detritus sites--tables 20 and 21; ground water sites--tables 22-36; and quality-assurance field blanks--table 37. Site names listed in tables 1 and 22 correspond to those in WATSTORE (the USGS National WATER data STOrage and RETrieval system). Representative daily discharge and water-quality data, for TJ Drain (site 21, fig. 4), are shown in figures 9-13.

SOURCES OF STUDY-FUNDED DATA NOT TABULATED HEREIN

The results of several technical investigations that were an integral part of the 3-yr detailed study were published prior to this report. Those already-published reports, which contain data that are not included herein, are by Ingersoll and others (1988), Harms and others (1990), Oremland and others (1990), and Tidball and others (1990). Daily statistics of streamflow at TJ Drain (station no. 10312274), Paiute Diversion Drain (10312250), and D-Line Canal (10312267) in Stillwater WMA; and A-Drain (10351356) in Fernley WMA are listed by Pupacko and others (1990, p. 138-140 and 253).

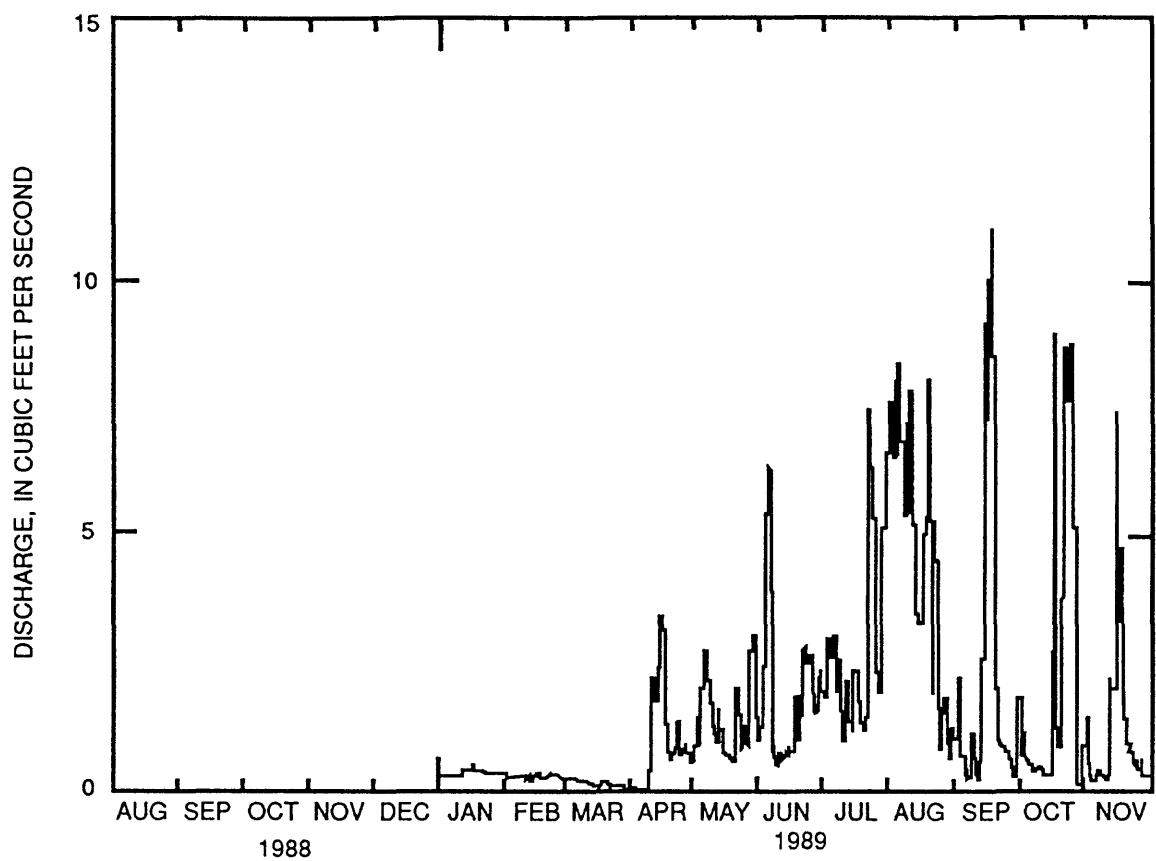

FIGURE 9 --Daily mean discharge at site 21, TJ Drain in Stillwater Wildlife Management Area (figure 4), from January through November 1989. Data are listed in table 8.
Note: No data are available for August-December 1988.

20		TJ-1 DRAIN abv TJ Drain nr FIR boundary	10312235	Input to main TJ Drain; high trace element concentrations
21	(10)	TJ DRAIN at wildlife entrance nr Stillwater	10312274	Input to Palute Drain; high trace element concentrations; QW monitor site
22		D-LINE CANAL blw East Lake nr Stillwater	10312267	Input to Palute Drain; QW monitor site
23		PAUTE DIVERSION DRAIN abv D-line Canal	10312250	Input to main Palute Drain; QW monitor site
24	(9) (13)	PAUTE DRAIN at wildlife entrance nr Stillwater SOUTH LEAD LAKE at landing nr Stillwater	10312270 393643118310501	Input to Lead Lake Secondary impoundment; wildlife concern, historical recreational use area
25		SOUTH LEAD LAKE sw of landing nr Stillwater, NV	393652118311201	QW monitor site
26	(15)	STILLWATER Pt DIV DRAIN nr Stillwater, NV	10312215	Main input to Stillwater WMA; QW monitor site
27		STILLWATER Pt Res nr center	393054118303801	Primary impoundment for Stillwater WMA; wildlife concern
28				
29		STILLWATER EAST-WEST CANAL blw outlet STILLWATER SLOUGH at Stillwater	10312216 10312218	Output of Stillwater Pt. Reservoir Main input to Canvasback area; historical stream channel
30	(18)			
31	(32)	GOOSE LAKE at landing nr Stillwater	393713118254001	Secondary impoundment; wildlife concern
32		HUNTER DRAIN abv Stillwater Rd nr Stillwater	1031221850	Upgradient site; seepage input area; high salinity levels
33		HUNTER DRAIN at Finger site nr Stillwater, NV	1031221880	Bioassay site; high salinity levels
34		HUNTER DRAIN at canal crossing nr Stillwater	1031221905	Midgradient site; high salinity levels
35	(20)	HUNTER DRAIN at Division Rd nr Stillwater, NV	1031221920	Dowgradient site; high salinity levels; wildlife concerns
36	(21)	LEAD LAKE CANAL at Hunter Rd nr Stillwater, NV	1031221930	Main output of Lead Lake; wildlife concern
37		FOXTAIL LAKE nr inlet nr Stillwater, NV	393333118283401	Secondary impoundment; wildlife concern
38	(33)	DRY LAKE nr inlet nr Stillwater, NV	393515118264801	Secondary impoundment; wildlife concern
39	(31)	EAST ALKALI LAKE at outlet nr Stillwater, NV	393546118233301	Secondary impoundment; wildlife concern
40	(22)	CATTAIL LAKE at outlet nr Stillwater, NV	393601118255401	Secondary impoundment; wildlife concern
41	(23)	SWAN CHECK at outlet nr Stillwater, NV	393907118263101	Secondary/terminal impoundment; wild- life concern
42	(24)	PINTAIL BAY nr center nr Stillwater, NV	394115118253201	Terminal impoundment; wildlife concern; high salinity

TABLE 1.--Principal surface-water and bottom-sediment sampling sites in the study area, 1987-89--Continued

Site number ¹	Previous site number ²	Site name	U.S. Geological Survey site identification ¹	Rationale for site selection
Fernley Wildlife Management Area Sites				
43		"A" DRAIN at US 50 Alt nr Fernley, NV	10351345	Input to main "A" Drain
44		FERMLEY DRAIN at US 95 Alt nr Fernley, NV	10351335	Input to "A" Drain
45		STREIFF DRAIN at US 50 Alt nr Fernley, NV	10351353	Input to "A" Drain
46	(36)	"A" DRAIN at powerline crossing nr Fernley, NV	10351356	Main input to Fernley WMA ponds
47		SOUTH POND at outlet nr Fernley, NV	393708119073801	Main secondary/terminal impoundment; wildlife concerns
48		NORTH POND at outlet nr Fernley, NV	393730119072301	Terminal drainage; wildlife concerns
49		NORTH-EAST POND at outlet nr Fernley, NV	393730119064101	Terminal drainage; wildlife concerns;
50		FREEWAY POND north of I-80 at Mile 58	394228119054301	high salinity
51		BRADYS HOT SPRINGS CREEK at road crossing	10336150	Background pond for nonirrigated area
Massie Slough Sites				
52	(35)	HAZEN DRAIN abv Massie Slough nr Hazen, NV	393448119001001	Main input to Massie Slough
53		MASSIE SLOUGH at Massie	393609118575401	terminal impoundment; wildlife concerns
Humboldt Wildlife Management Area Sites				
54		HUMBOLDT RIVER at Derby Rd nr Lovelock, NV	10336000	Input to Upper/Lower Humboldt Lake; historical flow data
55		ARMY DRAIN at Iron Bridge nr Toulon, NV	10336040	Major input to Upper Humboldt Lake
56	(37)	UPPER HUMBOLDT LAKE nr center nr Toulon, NV	40009118372001	Terminal impoundment; wildlife concerns
57		TOULON DRAIN at Derby Field Rd nr Toulon, NV	10336035	Major input to Toulon Lake
58	(38)	TOULON LAKE, WESTGARD POND, nr Toulon, NV	400307118363001	Terminal impoundment; wildlife concerns

¹ Each data-collection site is assigned a unique identification number on the basis of geographic location. In this table, lakes and miscellaneous stream sites are identified by a standard 15-digit "latitude-longitude" system; stream- and spring-measuring stations use a "downstream order" system, an 8- to 10-digit number. For example, station number 10312150 consists of a two-digit part number (10) followed by a 6- to 8-digit downstream-order number, 312150. The part number refers to a drainage area or group of areas that is generally regional in extent. Records in this report are for sites in Part 10 (the Great Basin). The downstream-order number is assigned according to the geographic location of the station in the drainage network; larger number stations are downstream from smaller number stations.

The standard site identification is based on the grid system of latitude and longitude. The number consists of 15 digits. The first six digits denote the degrees, minutes, and seconds of latitude; the next seven digits denote the degrees, minutes, and seconds of longitude; and the last two digits (assigned sequentially) identify the sites within a 1-second grid. The assigned number is retained as a permanent identifier even if a more precise latitude and longitude are later determined. For convenience, a short site number also is used in this report and those short numbers are shown in figures 1-6.

² Previous site numbers from Hoffman and others (1990, pl. 1).

TABLE 2.--Particle-size distribution in bottom-sediment samples from in and near Stillwater, Fernley, and Humboldt Wildlife Management Areas, 1988

[Symbol: --, all sediment is finer than indicated particle size]

Site number (table 1)	Date	Percent finer than particle size (in millimeters) indicated

¹ The total amount of a given constituent in a bottom-sediment sample, regardless of its physical or chemical form. This term is used only when the analytical procedure assures the measurement of at least 95 percent of the constituent present in the sample. A knowledge of the expected form of the constituent in the sample, as well as the analytical methodology used, is required to judge when the results should be reported as "total."

TABLE 5.--Total-recoverable¹ trace-element concentrations in bottom-sediment samples from in and near Stillwater and Fernley Wildlife Management Areas, 1989

[Concentrations expressed as milligrams per kilogram, dry weight;
Symbols: <, less than; --, not determined]

¹ "Total-recoverable" is the amount of a given constituent that is in solution after a bottom-sediment sample has been extracted or digested by a method that results in dissolution of readily soluble substances. Complete dissolution of all particulate matter is not achieved by the extraction or digestion treatment employed and there is reason to suspect that the determination actually represents something less than the "total" amount (95 percent) of the constituent sought in both phases of the sample.

TABLE 6.--Concentrations of organochlorine compounds and carbon in bottom-sediment samples from the study area, 1987-88

¹ Represents fraction of water contained within core sample as pore fluid.

² Represents water sample collected from drain in vicinity of where core sample was obtained.

³ Represents water sample collected adjacent to the top of the core.

¹ Natural-uranium values in pCi/L are calculated from corresponding $\mu\text{g/L}$ values by assuming that the activity ratio of uranium-234 to uranium-238 is 1.

TABLE 19.--Stable-isotope data¹ for in surface-water samples from in and near Stillwater and Fernley Wildlife Management Areas, 1989

[Symbol: --, not determined]

Site number (figs. 4, 5)	Date	Delta carbon-13 of carbonate species (permil)	Delta deuterium of water (permil)	Delta oxygen-18 of water (permil)	Delta sulfur-34 of sulfate (permil)
<u>Background Site</u>					
4	03-23-89	--	-96	-12.9	--
4	06-16-89	-9.60	-98	-12.4	3.90
<u>Stillwater Wildlife Management Area</u>					
21	06-12-89	-8.00	--	--	8.00
23	06-12-89	-13.3	--	--	4.80
25	06-12-89	-1.60	--	--	7.70
<u>Fernley Wildlife Management Area</u>					
46	06-13-89	-10.6	--	--	-2.00
47	06-13-89	-5.40	--	--	-1.60

¹ The stable isotopes evaluated herein are carbon-13 relative to carbon-12 ($^{13}\text{C}/^{12}\text{C}$), deuterium (hydrogen-2) relative to hydrogen-1 ($\text{D}/^{1}\text{H}$), oxygen-18 relative to oxygen-16 ($^{18}\text{O}/^{16}\text{O}$), and sulfur-34 relative to sulfur-32 ($^{34}\text{S}/^{32}\text{S}$). Each ratio is determined for a water sample, and then related mathematically to the comparable ratio for the following international reference standards: Peedee belemnite for carbon, Vienna Standard Mean Ocean Water for hydrogen and oxygen, and Canyon Diablo Troilite for sulfur isotopes. By convention, the computed results are expressed as "delta carbon-13," "delta deuterium," "delta oxygen-18," and "delta sulfur-34;" the units of measure are parts per thousand (abbreviated "permil"). A negative delta value indicates that the water sample is isotopically lighter than the standard (that is, for example, the water sample has a smaller proportion of deuterium, relative to hydrogen-1, compared to the standard).

TABLE 20.—Moisture content and trace-element concentrations in biological samples from the study area, 1987-89

¹ A local site designation is used in Nevada to identify a site by hydrographic area (Rush, 1968) and by the official rectangular subdivision of the public lands referenced to the Mt. Diablo base line and meridian. Each site designation consists of four units: The first unit is the hydrographic area number. The second unit is the township, preceded by an N or S to indicate location north or south of the base line. The third unit is the range, preceded by an E to indicate location east of the meridian. The fourth unit consists of the section number and letters designating the quarter section, quarter-quarter section, and so on (A, B, C, and D indicate the northeast, northwest, southwest, and southeast quarters, respectively), followed by a number indicating the sequence in which the site was recorded. For example, site 101 N20 E31 07BDCA1 is in the Carson Desert (hydrographic area 101). It is the first site recorded in the northeast quarter of the southwest quarter of the southeast quarter of the northwest quarter of section 7, Township 20 North, Range 31 East, Mount Diablo base line and meridian.

² The standard site identification is based on the grid system of latitude and longitude. The number consists of 15 digits. The first six digits denote the degrees, minutes, and seconds of latitude; the next seven digits denote the degrees, minutes, and seconds of longitude; and the last two digits (assigned sequentially) identify the sites within a 1-second grid. For example, site 393651118325701 refers to 39° 36' 51" latitude and 118° 32' 57" longitude, and it is the first site recorded in that 1-second grid. The assigned number is retained as a permanent identifier even if a more precise latitude and longitude are determined later.

TABLE 23.--Lithologic logs of wells in and near Stillwater and Fernley Wildlife Management Areas, 1987-88

Material ¹	Thickness (feet)	Depth (feet)
<u>Stillwater Wildlife Management Area</u>		
<u>Lead Lake Well 1 (site 59):</u>		
Sand, fine to very fine grained, pale brown (5YR5/2), well sorted, rounded, quartz, feldspar, dark grains -----	5.0	5.0
Sand, fine to very fine grained, clayey, light olive gray (5Y5/2), poorly sorted, increasing clay content with depth -----	10.0	15.0
Sand, very fine grained, very light gray (N8), well sorted, angular -----	.2	15.2
Sand, fine to very fine grained, clayey, light olive gray (5Y5/2), poorly sorted -----	4.8	20.0
<u>Lead Lake Well 2 (site 60):</u>		
Sand, very fine grained, moderate brown (5YR3/4), poorly sorted, rounded -----	4.0	4.0
Sand, fine to very fine grained, clayey, light olive gray (5Y5/2), poorly sorted, rounded -----	6.0	10.0
Sand, very fine to medium grained, clayey, grayish brown (5YR3/2), poorly sorted, well rounded, lithic fragments to 1 inch diameter -----	.5	10.5
Sand, fine to very fine grained, clayey, light olive gray (5YR3/2), poorly sorted, rounded -----	5.5	16.0
Sand, very fine grained, very light gray (N8), well sorted, angular -----	.3	16.3
Sand, fine to very fine grained, clayey, greenish gray (5G6/1), poorly sorted, some oblong rounded grains -----	1.7	18.0
<u>Lead Lake Well 3 (site 61):</u>		
Sand, very fine grained, silty, dusky brown (5YR2/2), poorly sorted, dark rock fragments -----	2.5	2.5
Sand, very fine grained, to silt, clayey, light olive gray (5Y5/2), poorly sorted, angular to subangular, dark rock fragments -----	5.5	8.0
Sand, very fine grained, very light gray (N8), well sorted, angular -----	.3	8.3
Sand, very fine grained, silty to clayey, light olive gray (5Y5/2) -----	4.7	13.0
Sand, fine to very fine grained, clayey to silty, dusky yellow green (5GY5/2) -----	2.0	15.0

TABLE 23.--Lithologic logs of wells in and near Stillwater and Fernley Wildlife Management Areas, 1987-88--Continued

Material ¹	Thickness (feet)	Depth (feet)
<u>Lead Lake Well 4 (site 62):</u>		
Sand, very fine grained, silty, dark yellowish brown (10YR4/2), organic matter (roots) -----	2.0	2.0
Sand, fine grained, clayey, light olive gray (5Y5/2) -----	4.0	6.0
Clay, silty, light olive gray (5Y5/2), many thin lenses of fine-grained sand -----	1.5	7.5
Sand, fine to very fine grained, silty, dark yellowish brown (10YR4/2), poorly sorted, subangular to subrounded -----	.5	8.0
Clay, silty, light olive gray (5Y5/2), many thin lenses of fine-grained sand -----	3.5	11.5
Sand, very fine grained, very light gray (N8), well sorted, angular -----	.4	11.9
Clay, silty, light olive gray (5Y5/2) -----	1.1	13.0
<u>Lead Lake Well 5 (site 63):</u>		
Sand, very fine grained, brownish black (5YR2/1), well sorted, subangular to subrounded -----	3.0	3.0
Clay, silty, light olive gray (5Y5/2), lithic fragments to 0.75 inch diameter -----	1.5	4.5
Sand, very fine grained, very light gray (N8), well sorted, angular -----	.1	4.6
Clay, silty, light olive gray (5Y5/2), lithic fragments to 0.75 inch diameter -----	8.4	13.0
Sand, very fine grained, very light gray (N8), well sorted, angular -----	.5	13.5
Clay, silty, light olive gray (5Y5/2), lithic fragments to 0.75 inch diameter -----	.5	14.0
<u>Lead Lake Well 6 (site 64):</u>		
Sand, very fine grained, grayish brown (5YR3/2), well sorted, subrounded to rounded -----	3.0	3.0
Clay, silty, grayish olive (10Y4/2) mottled with grayish brown (5YR3/2) -----	3.5	6.5
Clay, silty to sandy, yellowish gray (5Y7/2) mottled, friable -----	2.5	9.0
Clay, silty, light olive gray (5Y5/2) -----	7.0	16.0
<u>Lead Lake Well 7 (site 65):</u>		
Sand, very fine grained, clayey, grayish brown (5YR3/2), subrounded to rounded, white crystalline needles near surface -----	2.5	2.5
Clay, silty, light olive gray (5Y5/2) mottled with layers of brownish black (5YR2/1) -----	3.0	5.5
Clay, silty, light olive gray (5Y6/1) -----	6.0	11.0

TABLE 23.--Lithologic logs of wells in and near Stillwater and Fernley Wildlife Management Areas, 1987-88--Continued

Material ¹	Thickness (feet)	Depth (feet)
<u>Lead Lake Well 8 (site 66):</u>		
Sand, very fine grained, clayey, brownish black (5YR2/1) -----	2.5	2.5
Sand, very fine grained, clayey, light olive gray (5Y5/2), gastropods, 6-inch thick layer of very fine grained sand (dark yellowish brown, 10YR4/2) with subangular to subrounded grains at 13 feet -----	11.5	14.0
<u>Fernley Wildlife Management Area</u>		
<u>FWA-2A Well (site 74):</u>		
Sand, very fine grained, silty, pebbly, very pale orange (10YR8/2), poorly sorted, volcanic-rock fragments abundant -----	9.0	9.0
Sand, very fine grained, clayey, pebbly, grayish orange (10YR7/4), poorly sorted -----	4.0	15.0
Sand, very fine grained, clayey, pale yellowish brown (10YR6/2), poorly sorted -----	3.0	18.0
Sand, very fine grained, clayey, dark yellowish brown (10YR4/2), poorly sorted -----	4.0	22.0
Clay, silty, dark yellowish brown (10YR4/2) -----	17.0	39.0
Sand, gravel, and clay interbedded, dark yellowish brown (10YR4/2), gravel mostly volcanic-rock fragments to 1 inch diameter -----	21.0	60.0
<u>FWA-3A Well (site 76):</u>		
Sand, fine grained, silty, pebbly, pale yellowish brown (10YR6/2) -----	14.0	14.0
Sand, very fine grained, clayey, dark yellowish brown (10YR4/2) -----	5.0	19.0
Sand, fine grained, dark yellowish brown (10YR4/2), well sorted, rounded, mica flakes, dark minerals -----	31.0	50.0
<u>FWA-3 Well (site 78):</u>		
Sand, very fine grained, silty, clayey, dark yellowish brown (10YR4/2), poorly sorted, rounded, quartz, mica, some dark minerals -----	3.0	3.0
Clay, silty, dark yellowish brown (10YR4/2), poorly sorted, some mica flakes -----	16.0	19.0
Sand, very fine grained, clayey, dark yellowish brown (10YR4/2), poorly sorted, subrounded, quartz, feldspar, mica, red-stained grains, dark minerals -----	10.0	29.0
Clay, sandy (very fine grained), dark yellowish brown (10YR4/2), quartz, feldspar, mica, dark minerals -----	2.0	31.0

TABLE 23.--Lithologic logs of wells in and near Stillwater and Fernley Wildlife Management Areas, 1987-88--Continued

Material ¹	Thickness (feet)	Depth (feet)
FWA-4 Well (site 79):		
Silt, clayey to silty clay, dark yellowish brown (10YR4/2), minor mica -----	10.0	10.0
Sand, very fine grained, silty to clayey, dark yellowish brown (10YR4/2), mica, dark mineral grains -----	4.0	14.0
Sand, very fine grained, dark yellowish brown (10YR4/2), well sorted, quartz, feldspar, mica, some mafic minerals -----	2.0	16.0
FWA-5 Well (site 80):		
Sand, very fine grained to silt, clayey, dark yellowish brown (10YR4/2), poorly sorted, quartz, dark minerals, red-stained lithic fragments, mica -----	4.0	4.0
Clay, silty, dark yellowish brown (10YR4/2), brittle -----	6.0	10.0
Silt, clayey, dark yellowish brown (10YR4/2), mica, dark mineral grains, quartz -----	4.0	14.0
Clay, silty, dark yellowish brown (10YR4/2), brittle -----	1.0	15.0
FWA-6 Well (site 81):		
Sand, fine grained, dark yellowish brown (10YR4/2), well sorted, subangular to rounded, quartz, mica, dark minerals -----	6.0	6.0
Silt, clayey, dark yellowish brown (10YR4/2) -----	6.0	12.0
Silt, clayey, to very fine grained sand, pale yellowish brown (10YR6/2), quartz, dark minerals -----	4.0	16.0
FWA-7 Well (site 82):		
Clay, silty (some very fine grained sand), pale yellowish brown (10YR6/2), some dark mineral grains -----	6.0	6.0
Clay, silty, dark yellowish brown (10YR4/2), plastic -----	3.0	9.0
Clay, silty, medium light gray (N6), some dark grains, biotite (?), oxidizes to light olive gray (5Y5/2) -----	2.0	11.0
Sand, very fine grained, clayey, grayish black (N2), quartz, mica, feldspar, red-stained volcanic lithic fragments -----	3.0	14.0
FWA-8 Well (site 83):		
Clay, sandy (very fine grained), light olive gray (5Y5/2) -----	7.0	7.0
Clay, silty, dark yellowish brown (10YR4/2), mica, quartz -----	5.0	12.0
Sand, very fine grained, clayey, grayish black (N2), poorly sorted, subangular to rounded, quartz, mica, feldspar, dark minerals, biotite -----	1.0	13.0

¹ Color codes (for example, "10YR5/2") are for undried cuttings or cores, on basis of Rock-Color Chart distributed by Geological Society of America.

TABLE 24.--Mineralogy of core-material samples from wells in and near Stillwater and Fernley Wildlife Management Areas, 1987-88

Site name and number (figs. 4,5)	Depth (feet below land surface)	Minerals present ¹	Minerals possibly present
<u>Stillwater Wildlife Management Area</u>			
Lead Lake Well 1 (site 59)	15	Calcite, plagioclase (andesine, labradorite), quartz; chlorite, illite, kaolinite, smectite; biotite, gypsum	
Lead Lake Well 3 (site 61)	13.5	Calcite, plagioclase (oligoclase), quartz; chlorite, illite, kaolinite smectite; biotite	Muscovite
Lead Lake Well 5 (site 63)	12	Plagioclase, quartz; illite, kaolinite, smectite	Calcite, chlorite, muscovite
<u>Fernley Wildlife Management Area</u>			
FWA-2A Well (site 74)	60	Calcite, plagioclase (andesine, bytownite, labradorite), quartz; chlorite, illite, kaolinite, smectite; hornblende, magnetite, potassium feldspar, pyroxene	
FWA-3A Well (site 76)	45	Plagioclase, potassium feldspar, quartz; chlorite, illite, kaolinite, smectite; hematite, pyroxene	
FWA-4 Well (site 79)	14	Plagioclase (andesine, labradorite), quartz; chlorite, illite, kaolinite, smectite; biotite, hornblende, pyroxene	
FWA-8 Well (site 83)	13	Plagioclase, quartz; illite, kaolinite, mixed-layer clay	Augite

¹ Minerals preceding first semicolon are major components (make up most of the sediment); minerals following first semicolon are clays; minerals following second semicolon are minor components (make up a few percent of sediment).

¹ The total amount of a given constituent in a core-maternal sample, regardless of its physical or chemical form. This term is used only when the analytical procedure assures the measurement of at least 95 percent of the constituent present in the sample. A knowledge of the expected form of the constituent in the sample, as well as the analytical methodology used, is required to judge when the results should be reported as "total."

² Numbers in parentheses indicate sample depth, in feet below land surface, at sites where more than one sample was taken. For the other sites, the sample depth is the well depth, listed in table 22.

TABLE 29.--Total-recoverable¹ trace-element concentrations in core-material samples from wells in and near Stillwater and Fernley Wildlife Management Areas, 1987-88

[Concentrations are expressed in milligrams per kilogram; samples at all sites were taken from the total depth level listed in table 22; symbol: <, less than]

¹ The amount of a given constituent that is in solution after a core-material sample has been extracted with hot hydrochloric acid solution. Complete dissolution of all particulate matter is not achieved by the extraction treatment and there is reason to suspect that the determination actually represents something less than the "total" amount (95 percent) of the constituent sought in both phases of the sample.

¹ The stable isotopes evaluated herein are carbon-13 relative to carbon-12 ($^{13}\text{C}/^{12}\text{C}$), deuterium (hydrogen-2) relative to hydrogen-1 (D/ ^1H), oxygen-18 relative to oxygen-16 ($^{18}\text{O}/^{16}\text{O}$), and sulfur-34 relative to sulfur-32 ($^{34}\text{S}/^{32}\text{S}$). Each ratio is determined for a water sample, and then related mathematically to the comparable ratio for the following international reference standards: Peedee belemnite for carbon, Vienna Standard Mean Ocean Water for hydrogen and oxygen, and Canyon Diablo Troilite for sulfur isotopes. By convention, the computed results are expressed as "delta carbon-13," "delta deuterium," "delta oxygen-18," and "delta sulfur-34;" the units of measure are parts per thousand (abbreviated "permil"). A negative delta value indicates that the water sample is isotopically lighter than the standard (that is, for example, the water sample has a smaller proportion of deuterium, relative to hydrogen-1, compared to the standard).

TABLE 37.--Concentrations of dissolved trace elements in quality-assurance field blanks, 1987-89

[Concentrations are expressed in micrograms per liter as the element.
Symbols: --, not determined; <, less than]
